Windows 10 OS features

Windows 10 has a number of features and preferences available to users. These include such things as:
Default Applications (default windows applications and also default applications for certain file types)

Startup (Applications that run at system start up)

Other items that form part of the OS are windows services, display settings, locale, regional settings which all form part of the features that allow the running of applications, user interface preferences and interaction etc.

File Folder options/changes
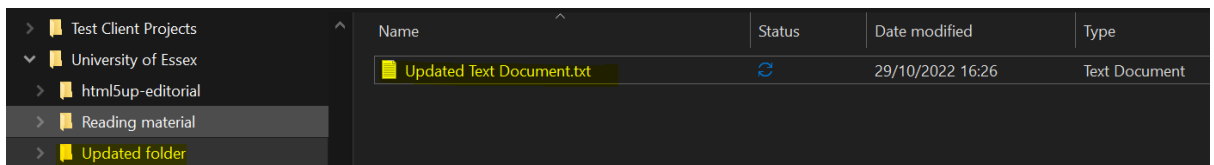

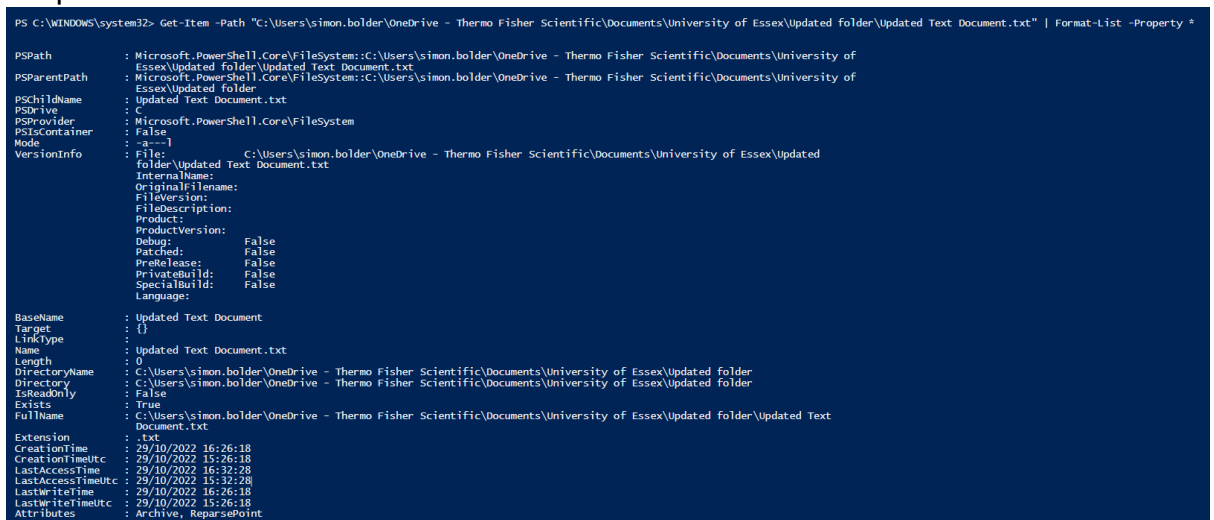

1. New Folder

2. New file in folder

3. New folder renamed to updated folder

4. Renamed file in renamed folder

5. Properties of file

6. Windows will record properties and attributes of a file. We can see creation times and accessed but no traceability of what the file was before it was renamed as it becomes a n file itself.

7. Properties can also be accessed by right clicking on both the folder and the file. Here we can see the general, sharing, security, and previous versions of the folder and file. These all apply to 'features' of the OS where we can see a range of user accessible properties and settings.
